New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal

cc the expression of a polynucleotide sequence which is differentially compound to the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical compound that regulates the activity of one or more of the cativity in an animal subjected to pain, a method for identifying a compound or small molecule that regulates the activity of one or more of the cativity in an animal of one or more of the polypeptides or identifying a compound useful in treating compound and a pharmaceutical composition comprising the one or more compound useful in treating compound less its activity is useful for preparing the one or more compound in e.g. spinal segmental nerve injury (SNI) in an animal for treating compound (e.g. spinal sequence injury (SNI)) in an animal (e.g. spinal sequence data for the presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: compound that specification, but was obtained in electronic form directly from WIPO at XX

The JTV1 coding sequence is located upstream from hPMS2. JTV1 cDNA can be used as probes to detect chromosome 7 deletions involving JTV1. Due to the overlapping promoter regions, deletions of JTV1 would also affect PMS2 (a mismatch repair gene) expression, leading to hereditary non-polyposis colorectal cancer. JTV1 can also be used to assay activity or competence of the PMS2 promoter region, the presence of JTV1 suggesting that the PMS2 promoter is intact. JTV1 sequences can also be used to guide homologous recombination at the PMS2 locus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel chromosome 7 gene, JTV1 - used f deletions, and PMS2 promoter activity.

                                                          The present invention relates to an isolated p38/JTV-1 protein for use as cc medicament. The p38/JTV-1 protein or the pharmaceutical composition is cuseful as medicament for treating breast cancer, large intestinal cancer, cuseful as medicament for treating breast cancer, large intestinal cancer, cuseful as medicament for treating breast cancer, large intestinal cancer, cc lung cancer, small cell lung cancer, stomach cancer, liver cancer, blood cancer, bone cancer, pancreatic cancer, skin cancer, head or neck cancer, cc catalous or intraocular melanoma, uterine sarcoma, ovarian cancer, blood cancer, anal cancer, colon cancer, fallopian tube carcinoma, cendemental carcinoma, cervical cancer, vulval cancer, vaginal carcinoma, cc endogkin's disease, esophageal cancer, small intestine cancer, endocrine cancer, thyroid cancer, parathyroid cancer, adrenal cancer, soft tissue ct tumour, urethral cancer, parathyroid cancer, adrenal cancer, soft tissue clukemia, lymphocytic lymphoma, bladder cancer, kidney cancer, ureter cancer, renal cell carcinoma, renal pelvic cancer, kidney cancer, ureter cancer, renal cell carcinoma, renal pelvic cancer, bituitary cc cancer, their combination. The protein is useful as a target for corcer, their combination. The present sequence represents the 1-cr amino acid sequence of p38/JTV-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated p38/JTV-1 protein, useful as medicament for treating cancer e.g., stomach, liver, blood, bone, pancreatic, skin, head or neck cancer and cutaneous or intraocular melanoma, as well as for screening new

The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

The invention useful in developmental biology and in elucidating cell signalling and insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB5737-printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                      125.5

SUBUNIT: Component of the multisynthetase complex which is comprised of a bifunctional glutamyl-prolyl-tRNA synthetase, the monospecific isoleucyl, leucyl, glutaminyl, methionyl, lysyl, arginyl, and aspartyl-tRNA synthetases as well as three auxiliary proteins, p18, p48 and p43. Binds FUBP1.

SIMILARITY: Contains 1 GST-like domain.
CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 312.
                                                                                                  301

SUBUNIT: Component of the multisynthetase complex which is comprised of a bifunctional glutamyl-prolyf-rRNA synthetase, the monospecific isoleucyl, leucyl, glutaminyl, methionyl, lysyl, arginyl, and aspartyl-tRNA synthetases as well as three auxiliary proteins, p18, p48 and p43.
SIMILARITY: Contains 1 GST-like domain.
                                 61

  SUBUNIT: Component of the multisynthetase complex which is comprised of a bifunctional glutamyl-prolyl-tRNA synthetase, monospecific isoleucyl, leucyl, glutaminyl, methionyl, lysyl arginyl, and aspartyl-tRNA synthetases as well as three auxi proteins, pl8, p48 and p43 (By similarity).

SIMILARITY: Contains 1 GST-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (Rel. 40, Last sequence update)

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence

is differentially expressed in neuronal tissue

of a first animal

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The polynucleotide or the compound that compound conjury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene conjury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene conformation). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: specification, but was obtained in electronic form part of the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition in the printed composition composition in the printed composition composition in the pr

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human tumour-associated antigenic target (TAT) CC polypeptides, and their related nucleic acids. The TAT polypeptides are coverexpressed in cancer tissues compared to normal tissues, and may thus mammals. The invention also relates to nucleic acid and polypeptide compared to neguence as effective teargets for the diagnosis and treatment of cancer in compared to the TAT nucleic acid and polypeptide compared to the TAT nucleic acids and compared to the TAT nucleic acids and polypeptide and antibody specific for a TAT polypeptide; a peptide or organic composition; and methods and compositions for the treatment or compositions of cancer in mammals. TAT polypeptide, a peptide or organic compositions of cancer in mammals. TAT polypeptide, are useful concreased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder, colorectal cancer, melanoma and leukaemia. TAT mucleic acids may further be chromosome identification and in gene therapy. The present sequence and corposents a TAT polypeptide of the invention.

The JTV1 coding sequence is located upstream from hPMS2. JTV1 cDNA can be used as probes to detect chromosome 7 deletions involving JTV1. Due to the overlapping promoter regions, deletions of JTV1 would also affect PMS2 (a mismatch repair gene) expression, leading to hereditary non-polyposis colorectal cancer. JTV1 can also be used to assay activity or competence of the PMS2 promoter region, the presence of JTV1 suggesting that the PMS2 promoter is intact. JTV1 sequences can also
                                                                                                                                                                                                                                                                                                                                                                                        Sequence 312 AA;

The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
